EXECUTIVE OVERVIEW

The calm way to run a hospital.

ZYVORA is Zyvor AI Labs' healthcare operating system: patients, wards, lab, pharmacy and billing in one secure place, with assistance that drafts and people who decide.

12
modules for clinicians, administrators and patients

9
roles, deny by default, plus relationship checks

181
documented API operations, one OpenAPI document

What it covers

Clinical	Patient registry, appointments and a waiting-room queue, SOAP notes with append-only revisions, prescribing, a patient portal and video visits.
Hospital	Emergency tracking board with triage decision support, wards, beds and admissions, laboratory with separate verification and critical alerts, imaging, pharmacy.
Business	Billing with exact money and tax rules as data, insurance pre-authorisation and claims, insights over eleven fixed metrics, facility setup.
Governance	Nine roles, a hash-chained audit trail with verification, break-glass access for restricted records, row-level tenant isolation in the database.
AI, with review	Off by default. Drafts only, no tools, identifiers removed first, and a named clinician reviews each clinical draft.

Why organisations choose it

- **Calm by design.** One workspace per encounter, a dashboard that shows what needs attention now, light and dark themes, keyboard shortcuts and a command palette.
- **Safe by default.** The database enforces who can see what, double-booking is impossible, signed notes cannot be changed, and every access to a record is on the audit trail.
- **Yours to run.** Self-hosted on Docker Compose, Kubernetes or k3s with your own identity provider; optional AI stays on a private network you control.

Status. Pilot-ready software, built and tested with synthetic data only. It is not a certified medical product and makes no regulatory or clinical-validation claim. See the Security and privacy posture sheet for the full list of limits.
